Bonus 1 — The 90-Minute SuiteDash Lock-In Protocol

A printable implementation checklist for turning the core PDF into one focused setup session.

How to use this

Do not open SuiteDash and wander. Open this checklist, pick one workflow, and stop when the first client path is usable.

Recommended workflow for v1:

Client record → intake form → portal access → project template → file/document request → invoice/payment → status/update notification.

Before you start: choose the workflow

- ☐ I picked one workflow to deploy first.
- ☐ I can describe the trigger in one sentence.
- ☐ I can describe the client-visible outcome in one sentence.
- ☐ I know who owns the workflow internally.
- ☐ I know what “done” means for the client.

If you cannot check these five boxes, do not configure features yet. Write the workflow first.

Minute 0-10: Define the first workflow

Write one sentence for each:

- Trigger:
- Client next step:
- Internal next step:
- Evidence of completion:

Choose one workflow spine:

- ☐ Lead-to-client conversion.
- ☐ Paid client onboarding.
- ☐ Project/status visibility.
- ☐ Support/escalation intake.
- ☐ Other:

Recommended v1 spine: paid client onboarding + status visibility.

Minute 10-20: Configure the client record

Minimum fields:

- [] Contact/company name standard chosen.
- [] Client status field exists.
- [] Owner/assignee field exists.
- [] Primary service/package field exists.
- [] Source or referral field exists.
- [] Next milestone / next step field exists.

Optional only if useful now:

- [] Budget authority.
- [] Implementation timeline.
- [] Primary pain point.
- [] Lead score.
- [] Payment status.

Stop rule: if a field will not change routing, status, reporting, or client experience, skip it for v1.

Minute 20-35: Build the intake form

- [] Form has a clear name.
- [] Form captures the minimum data needed to begin work.
- [] Every required field maps to a contact/project decision.
- [] No “nice to know” questions added.
- [] Submission creates or updates the right client record.
- [] Submission notifies the internal owner.

Recommended v1 fields:

1. Name.
2. Email.
3. Company.
4. Service/package purchased.
5. Desired outcome.
6. Deadline or target launch date.
7. Files/assets needed.

- 8. Best contact method.
 - 9. Anything blocking kickoff.
-

Minute 35-50: Build the portal shell

- [] Logo/brand basics added.
- [] Client has one obvious home/start page.
- [] Portal explains what to do next.
- [] Files/documents are easy to find.
- [] Invoice/payment location is clear.
- [] Project/status area is visible if used.

Do not spend more than 15 minutes on design in v1. Your first portal needs clarity, not beauty.

Minute 50-65: Build the project template

- [] Project template has 3-5 phases max.
- [] Each phase has owner, due date logic, and definition of done.
- [] Client-visible tasks are separated from internal tasks.
- [] File/request tasks have clear evidence requirements.
- [] QA/review task exists before delivery is marked complete.

Suggested phases:

1. Kickoff / access.
 2. Intake / asset collection.
 3. Setup / implementation.
 4. Review / approval.
 5. Delivery / follow-up.
-

Minute 65-80: Add one automation

Pick one automation only.

Option A — Intake submitted:

- [] Create/update contact.
- [] Assign project template or task.

- [] Notify internal owner.
- [] Send client confirmation.

Option B — Invoice paid:

- [] Update client status.
- [] Send welcome/access email.
- [] Assign onboarding task/project.
- [] Notify owner.

Option C — Milestone changed:

- [] Update status.
- [] Notify client or internal owner.
- [] Create follow-up if blocked.

Stop rule: one working automation beats five half-configured automations.

Minute 80-90: QA with a fake client

Run a test client through the flow.

- [] Contact/company record is created or updated correctly.
 - [] Intake answers land where you expect.
 - [] Portal access and next step are clear.
 - [] Project template creates the right tasks.
 - [] Notification/automation fires once, not zero or twice.
 - [] Invoice/payment/file path is understandable.
 - [] Internal owner knows what to do next.
 - [] Client knows what to do next.
-

Completion criteria

Your first SuiteDash deployment is “locked in” when:

- [] One client workflow can run from beginning to end.
- [] The client has one place to go for the next step.
- [] The internal owner has one source of truth.
- [] At least one repeated handoff is automated.
- [] Nothing outside the workflow was configured “just in case.”

What to do next

If the workflow works, use it with one real client before expanding. If it breaks, fix the weakest handoff before adding features.

Version: v1 operator edition. SuiteDash is referenced as the product subject; this package is not official SuiteDash documentation or a replacement for SuiteDash support.
